This is a N/A tagged story. All tags that are not allowed in this forum are subject to removal without notice. tag; Category; This is a bad story, don't read it. tag; Fandom; This is a fanfiction, please see the plot tags for the details. leaked Games - From the Tech Blog Team at Gotta Be Mobile With apologies to Megan Pope and others, fangirls, the next up on the J-Pop Girls: "Honey Bunny" is from Ami Suzuki's "Parallel World More" album from July. The song is a male version of the girl's song of the same name and is about a man crushing on his classmate. The girl in this song is named Houra, and while she's my absolute favorite singer, I'm not exactly crazy about how the song sounds. I don't want to bash the song, but I'm not quite as fond of Ami's voice as others are (and I love the fact that she's doing J-pop here, which generally makes me cringe). Download this song, check out some other Ami songs, and tell us how much you love Ami on the forums! Update: Some of our J-pop readers have pointed out that this is the same song from the CD that is being released in North America as "Honey Bunny". In a sense, I guess that's true, as that's the one I was thinking of. But in a larger sense, the song just feels more interesting to me when I know it's not the thing they are releasing in the U.S. (I think only the short version on the CD and the version that is streaming on the bandcamp are actually English). Regardless, the song is the same song and I think it's fun to watch the band master this one! After all, it's not like I want to break down J-pop fans or say they're bad. I'm just trying to make you listen to these songs! ;D That was a lie. The truth is that we're never going to stop listening to J-Pop. And even if the rest 50b96ab0b6

The list includes girls and boys bands that made great music from Taiwan. [read more]Q: Forwarding messages with rabbitmq-c I'm using rabbitmq-c on windows, and want to do a forward message between two queues. I'm following the tutorial here: At the end of the chat_client.cpp I have: // send conversation to the user channel_x->send(channel_y->recv()); And in the chat_manager class I have a method to do this: void chat_manager::publish_to_user(channel_x_t x, channel_y_t y) { conversation_t conversation(x, y); // TODO: publish conversation to user } But it's not working. Could you help me understand what is the problem? Thanks, A: channel_x->send(channel_y->recv()); That will attempt to send the content of a channel_x object to the content of a channel_y object. channel_x is going to be a connection (you define it as such), channel_y is going to be a queue (as you declare it as such) but they are different things. They have different "data types". To send the "content" of channel_x to the content of channel_y you must use channel_x->send() to send the content of channel_x to the content of channel_y. As an example: #include #include #include boost::asio::io_service ios; boost::asio::ip::tcp::iostream stream(ios); // Declare channel x as a connection to a queue (not a queue like object) boost::asio::ip::tcp::iostream channel_x(stream, tcp::endpoint{boost::asio::ip::v4(), 1337}); // Declare channel y as a queue (not a connection object) boost:
